

The Fleet: evidence guide

Jonathan Simone · Pokémon TCG AI Battle Challenge Strategy

The report follows three game-strategy experiments, the entered deck and a separate learning branch. This package lets a reader inspect the argument, reproduce saved-result arithmetic and distinguish those checks from historical gameplay.

Start with the strategic decisions

Case	Question and supported result	Start here
Hand disruption and targeting	Separate card/rule changes; large counter gains in two tested Alakazam cells, broader benefit unresolved.	Counter methods
Energy recovery	One search slot becomes recovery. First target batch improves; the wider panel does not establish improvement.	Recycler case
Knockout priority	One large scoring bonus produces opposite effects across seven implementations. A universal upgrade is unsupported.	KO case
Entered player and deck	Tetsutani's public c61 is the unmodified entry. Its score is separate from every research result.	Source notes, reference 7
Owned learning components	Source/target option features, recurrence and sequential STOP; seven prescribed-score checks, with competitive learning still unfinished.	Original components

Recount the results

From the extracted archive, the following checks use Python's standard library and no game engine:

```
python -X utf8 numerical/verify_results.py
python -X utf8 cases/recycler/verify.py
python -X utf8 cases/ko/verify.py
```

See [REPRODUCING.md](#) for exact invocation details, remaining source/representation/sensitivity checks and the optional CPU PyTorch selection demonstration. Counter and KO arithmetic uses exported terminal outcome rows. Recovery arithmetic uses exported historical aggregate receipts; original game rows were not recovered. No command above replays games or trains a model.

Follow the research process

[Five traced research cases](#) show policy investigation, labeling, review/repair and research memory. [SOURCE-NOTES.md](#) connects report references to source excerpts, identities, methods and limitations. [CONTRIBUTIONS.md](#) separates original work, public foundations and future integration.

The public repository is [poketcg-research](#). The evidence is available without requesting access. The package omits organizer engine/card assets, artwork, full player weights and third-party policy implementations. Its [NOTICE](#) preserves rights and competition-use boundaries. Source hashes establish file identity; they do not certify complete historical execution or universal strategy quality.
